

Using Lua \LaTeX to typeset RTL text with elepar

Abstract

This file provides an example on how to use elepar and Lua \LaTeX to typeset a right to left text with its translation on the facing page¹.

As you can see, the switch to RTL convention is made *before* the `pstart`. It must be also called inside `\elepsection`.

For an example with X \LaTeX , look at `parallel-column-two-languages.tex` file.
