

The auto-pst-pdf package

Will Robertson & Johannes Große

wspr 81 at gmail dot com

2009/04/26 vo.6

1 Future plans

This package is no longer being actively developed (although I'm happy to add small features and fix bugs). I (Will Robertson) first wrote auto-pst-pdf to aid the use of psfrag in pdf \LaTeX documents. The newer pstool package does this in a more efficient and convenient manner, and I suggest using that package instead if that's what you're using this package for. However, pstool does not yet support full pst-pdf usage, so auto-pst-pdf is certainly not deprecated yet.

2 Basic usage

This package provides a wrapper around pst-pdf to automatically accomodate for typesetting either with DVI or PDF output. With default package option [on], typesetting under pdf \LaTeX will automatically initiate an auxiliary compilation of $\text{\LaTeX} \rightarrow \text{dvips} \rightarrow \text{ps2pdf} \rightarrow \text{pdfcrop}$ to generate the required PDF figures for the document.

After this has been done and the figures no longer need to be re-generated, the package can be given the [off] option to save compilation time:

```
\usepackage[off]{auto-pst-pdf}
```

If the extension of your \LaTeX document is not .tex, then it must be declared when the package is loaded (*e.g.*, I like to use .ltx to distinguish between Plain \TeX and \LaTeX files):

```
\usepackage[ext=ltx]{auto-pst-pdf}
```

3 Requirements

pdf \TeX must be called with the -shell-escape option. Requires the following packages: ifplatform, pst-pdf, xkeyval.

Heiko Oberdiek's `pdfcrop` Perl script¹ must be installed for the default `crop=on` option (see section 5). Under Windows, a Perl installation² will also need to be installed even though `pdfcrop` itself is part of MiK^TE_X.

4 Provided macros for including graphics

Macros are provided to easily facilitate figures created by the MATLAB package `laprint`³ and the Mathematica package `MathPSfrag`⁴. Also, a generic `psfrag`⁵ wrapper is provided.

<code>\mathfig{<filename>}</code>	insert a Mathematica graphic from MathPSfrag (without -psfrag suffix)
<code>\matlabfig{<filename>}</code>	insert a MATLAB graphic from <code>laprint</code>
<code>\psfragfig{<filename>}</code>	insert an EPS with <code>psfrag</code>

The above commands all accept an optional argument which is passed to the underlying `\includegraphics` macro.

The `\matlabfig` command meddles slightly with the output of `laprint`; the font sizes in the figure will always be as originally defined. (This is unavoidable I'm afraid.)

For the `\psfragfig` command, `psfrag` statements are input from either or both of the files `<document>-psfrag.tex` and `<filename>-psfrag.tex` if they exist. Furthermore, supplementary `\psfrag` statements can be added in a trailing optional argument:

`\psfragfig[<graphics options>]{<filename>}[<psfrag statements>]`
 Manual `\psfrags` override those in `<filename>-psfrag.tex` which in turn override those in `<document>-psfrag.tex`.

5 Advanced package options

Better results are obtained by using `pdfcrop` in the auxiliary compilation process, and this is used by default. It is not installed by default, however, and will not always be required. Cropping with this tool can be controlled with the `crop` option:

`\usepackage[crop=off]{auto-pst-pdf}`

The package automatically deletes the files generated during the auxiliary L^AT_EX compilation. Which files are deleted are chosen by passing a list of file extensions

¹<http://www.ctan.org/tex-archive/support/pdfcrop/>

²Freely available: <http://www.activestate.com/Products/activeperl/index.plex>

³<http://www.uni-kassel.de/fb16/rat/matlab/laprint/>

⁴<http://wwwth.mppmu.mpg.de/members/jgrosse/mathpsfrag/>

⁵<http://www.ctan.org/tex-archive/help/Catalogue/entries/psfrag.html>

to the `cleanup` option (no error message or warning is produced if a file is specified that does not exist). The default list is:

```
\usepackage[cleanup={log,aux,dvi,ps, pdf}]{auto-pst-pdf}
```

If you're using cross-references of any kind within the graphics being processed by `pst-pdf`, it will be necessary to perform the auxiliary compilation more than once to resolve them. The exact number will vary by exact application, and must be set explicitly:

```
\usepackage[runs=2]{auto-pst-pdf}
```

The options passed individually to `latex`, `dvips`, `ps2pdf`, and `pdfcrop` in the auxiliary compilation process may all be customised, if you know what you're doing. The defaults for the latter three are

```
\usepackage[dvips={-o -Ppdf},  
           pspdf={-dAutoRotatePages=/None},  
           pdfcrop={}]{auto-pst-pdf}
```

The `LATeX` auxiliary compilation has some hard-coded options (see the source if you're interested), and further options can be appended if you wish. For example, to run the auxiliary compilation with more information written to the console, use the following package option:

```
\usepackage[latex={-interaction=nonstopmode}]{auto-pst-pdf}
```

Any package options that are not recognised are passed on to `pst-pdf`. As an example,

```
\usepackage[final]{auto-pst-pdf}
```

will load `pst-pdf` with the `final` package option, possibly overriding a global `draft` option from the class loading.

6 Acknowledgements

Many thanks to the authors of `pst-pdf`, `psfrag`, `laprint`, `MathPSfrag`, and `pdfcrop`. This package could not exist without their combined efforts over many years. Finally, Gernot HASSENPLUG deserves special mention for extensive testing, feature suggestions, and moral support :) Thanks, mate.

auto-pst-pdf implementation

7 Setup code

This is the package.

[1](#) \ProvidesPackage{auto-pst-pdf}[2009/04/26 v0.6 Wrapper for pst-pdf]

Change History

vo.3	General: Too many changes to list. Command execution totally re-written.	4
vo.4	General: Johannes tinkered with the code. Will will improve. :-) Will sorted it all out.	4
vo.5	General: <code>delay</code> option removed. Keep it simple, stupid! Removed <code>\ifdefined</code> to avoid e-TeX. Removed mucking about with image extensions. <code>\app@convert</code> : Fix PackageError (should have been a warning). <code>\matlabfig</code> : Redefine <code>\resizebox</code> for <code>laprint</code> . <code>\psfragfig</code> : Extend <code>\psfragfig</code> to accept arbitrary input for extra <code>\psfrag</code> commands.	4 8 8 6 9 10
vo.6	General: <code>runs</code> option added (thanks Joseph!) Pass unknown options to <code>pst-pdf</code> .	4 4

Required packages `pst-pdf` is loaded later on.

[2](#) \RequirePackage{ifpdf,xkeyval,ifplatform}

60 \fi
61 \ProcessOptionsX

```

Shorthands

```

62 \def\app@exe{\immediate\write18}
63 \def\app@nl{^^J\space\space\space\space}
64 \newcommand\app@PackageError[2]{%
65   \PackageError{auto-pst-pdf}{\app@nl #1^^J}{#2}}
66 \newcommand\app@PackageWarning[1]{%
67   \PackageWarning{auto-pst-pdf}{\app@nl #1^^JThis warning occurred}}
68 \newcommand\app@PackageInfo[1]{\PackageInfo{auto-pst-pdf}{#1}}

```

These are cute:

```

69 \newcommand\OnlyIfFileExists[2]{\IfFileExists{#1}{#2}{}}
70 \newcommand\NotIfFileExists[2]{\IfFileExists{#1}{}{#2}}

```

\app@convert #1 : command name
#2 : source file
#3 : destination file

Check if the source file exists and calls the command to generate the destination file. If the final file is not created, generate an error.

```

71 \def\app@convert#1#2#3{%
72   \OnlyIfFileExists{#2}{%
73     \app@exe{\csname app@cmd@\#1\endcsname{#2}{#3}}%
74     \NotIfFileExists{#3}{\app@PackageWarning{Creation of #3 failed.}}}}

```

\app@compile First we define the entire $\text{latex} \rightarrow \text{dvips} \rightarrow \text{ps2pdf} (\rightarrow \text{pdfcrop})$ command sequence. The actual call to the compilation macro follows thereafter. This macro contains the actual creation of the pdf container. Each processing step is in a separate macro to allow simple modification.

```

75 \def\app@compile{%
76   \app@cleanup
77   \app@remove@container
78   \loop\ifnum\c@app@runs > \c@ne
79     \app@convert{extralatex}{\jobname.\app@ext}{\jobname.dvi}%
80     \advance\c@app@runs\m@ne
81   \repeat

```

```

82   \app@convert{latex}{\jobname.\app@ext}{\app@jobname.dvi}%
83   \app@convert{dvips}{\app@jobname.dvi}{\app@jobname.ps}%
84   \if@app@crop@
85     \app@convert{pstoppdf}{\app@jobname.ps}{\app@jobname.pdf}%
86     \app@convert{pdfcrop}{\app@jobname.pdf}{\app@pics}%
87   \else
88     \app@convert{pstoppdf}{\app@jobname.ps}{\app@pics}%
89   \fi
90   \IfFileExists{\app@pics}
91     {\app@cleanup}
92     {\app@PackageWarning{Could not create \app@pics.
93       Auxiliary files not deleted.}}}

```

Command-line program to delete files:

```

94 \edef\app@rm{\ifwindows del \else rm -- \fi}

```

\app@try@rm Macro to delete files (comma-separated) if they exist:

```

95 \newcommand\app@try@rm[1]{%
96   \@for\@tempa:=#1\do{%
97     \OnlyIfFileExists{\@tempa}{\app@exe{\app@rm "\@tempa"}{}}
}

```

Remove pdf picture container:

```

98 \def\app@remove@container{\app@try@rm{\app@pics}}

```

Clean up auxiliary files: (\app@rm@files defined by the cleanup package option)

```

99 \def\app@cleanup{\app@try@rm{\app@rm@files}}

```

LATEX:

```

100 \def\app@cmd@latex#1#2{latex \app@latex@opts\space
101   "\unexpanded{\let\APPmakepictures\empty\input} #1"}
102 \def\app@cmd@extralatex#1#2{latex \app@latex@opts\space
103   "\unexpanded{\let\APPmakepictures\undefined\input} #1"}

```

dvips:

```

104 \def\app@cmd@dvips#1#2{dvips \app@dvips@opts\space -o "#2" "#1"}

```

ps2pdf:

```

105 \def\app@cmd@pstoppdf#1#2{ps2pdf \app@pspdf@opts\space "#1" "#2"}

```

pdfcrop:

```

106 \def\app@cmd@pdfcrop#1#2{pdfcrop \app@pdfcrop@opts\space "#1" "#2"}

```

7.1 Base functionality

For compilation, we use the [notightpage] option of `pst-pdf` and the `pdfcrop` Perl script because EPS figures can have elements that extend outside their bounding boxes, and end up with clipped content after `ps2pdf`. Otherwise the script `ps4pdf` would be sufficient.

pdf \LaTeX compilation Requires supplementary processing with `pst-pdf`:

```
107 \ifpdf
108   \if@app@off@\else
109     \ifshellescape
110       \app@exe{echo "  "}
111       \app@exe{echo "-----"}
112       \app@exe{echo "auto-pst-pdf: Auxiliary \LaTeX{} compilation"}
113       \app@exe{echo "-----"}
114       \app@compile
115       \app@exe{echo "-----"}
116       \app@exe{echo "auto-pst-pdf: End auxiliary \LaTeX{} compilation"}
117       \app@exe{echo "-----"}
118   \else
119     \app@PackageError{%
120       "shell escape" (or "write18") is not enabled:\app@nl
121       auto-pst-pdf will not work!}
122     {You need to run \LaTeX{} with the equivalent of
123       "pdflatex -shell-escape"\app@nl
124       Or turn off auto-pst-pdf.}%
125   \fi
126 \fi
127 \if@app@crop@
128   \PassOptionsToPackage{notightpage}{pst-pdf}
129 \fi
```

\LaTeX compilation Either we're calling `latex` from within a pdf \LaTeX run (see above) or the document is being compiled as usual.

```
130 \else
\LaTeX{} compilation from scratch (as in 'latex <document>.tex') — here the
postscript environment does nothing and document is processed 'normally':
```

```
131   \ifx\APPmakepictures@\undefined
132     \PassOptionsToPackage{inactive}{pst-pdf}
```

\LaTeX compilation induced by this package:

```
133 \else
134   \if@app@crop@
135     \PassOptionsToPackage{notightpage}{pst-pdf}
```

```

136     \fi
137   \fi
138 \fi

```

After the requisite package options have been declared depending on the execution mode, it's now time to load the package:

```
139 \RequirePackage{pst-pdf}
```

7.2 Extras for external packages

Commands are provided that mirror `\includegraphics` (and similarly accept an optional argument) for the output of different psfrag-related packages. This provides a consistent and easy way to include such figures in the document.

Please suggest wrappers for other packages that output psfrag figures (for example: SciLab, R, Maple, LabView, Sage, ... ?)

- `\matlabfig` We need to disable the scaling that `laprint` applies to `\includegraphics` in here, because otherwise labels that extend outside the bounding box of the generated PostScript file will change the intended width of the graphic.

```

140 \let\app@ig\includegraphics
141 \newcommand\matlabfig[2][]{%
142   \begin{postscript}
143     \renewcommand\resizebox[3]{##3}%
144     \renewcommand\includegraphics[2][]{\app@ig[#1]{##2}}%
145     \input{#2}%
146   \end{postscript}}

```

- `\mathfig` For Mathematica's MathPSfrag output

```

147 \newcommand\mathfig[2][]{%
148   \begin{postscript}
149     \input{#2-psfrag}%
150     \includegraphics[#1]{#2-psfrag}%
151   \end{postscript}}

```

- `\psfragfig` EPS graphics via psfrag. Include your psfrag commands in the files `<document>-psfrag.tex` and/or `<filename>-psfrag.tex`, where `<document>` is the filename of the main document and `<filename>` is the filename of the graphics inserted.

```

152 \newcommand\psfragfig[2][]{%
153   \@ifnextchar[
154     {\app@psfragfig[#1]{#2}}
155     {\app@psfragfig[#1]{#2}[]}}
156 \def\app@psfragfig[#1]{#2}{%
157   \begin{postscript}
158     \InputIfFileExists{#2-psfrag}{}{%

```

```
159      #3
160      \includegraphics[#1]{#2}%
161      \end{postscript}}
```

Finally, input any psfrag commands associated with the document:

```
162 \InputIfFileExists{\jobname-psfrag}{}{}
```
