

The `chbibref` package

Peter Wilson

2001/03/07

In the `article` class the title text printed by `\begin{thebibliography}` is given by the value of `\refname` (default `References`), while in the `report` and `chapter` classes the text is given by the value of `\bibname` (default `Bibliography`).

The command `\setbibref{<name>}` will set the title text for the Bibliography or the References to '`<name>`' for at least the `article`, `report` and `book` standard L^AT_EX classes, without having to be concerned which class is being used.

If you are using the `babel` package, put `\setbibref{...}` after the `\begin{document}`.
