1 Introduction

The standard biblatex fields allow to describe the author of a work, with the so called `authors` field. However, some works are published without name, or with pseudonyme, but the scholars know the real author. This package adds a new field `realauthor`, to specify the knew real author.

2 Basic use

2.1 The .bib file

Basically, you just have to add the real author name in the field `realauthor`, like in the two following examples:

```
@book{LeClerc1686,  
  Publisher = {Henry Desbordes},  
  Realauthor = {Jean le Clerc},  
  Title = {Défense des sentimens  
    De quelques Théologiens de Hollande  
    sur l'histoire critique du Vieux Testament  
    contre la réponse du Prieur de Bolleville},  
  Year = {1686}}
```

```

@book{Simon1686,
    Address = {Rotterdam},
    Author = {{Prieur de Bolleville}},
    Publisher = {Reinier Leers},
    Realauthor = {Richard Simon},
    Title = {Réponse au livre intitulé
        sentimens de quelques Theologiens de Hollande
        sur l'Histoire Critique du Vieux Testament},
    Year = {1686}

@book{noauthor-norealauthor,
    Title = {Here an anonymous work},
    }

@book{noauthor-norealauthor2,
    Title = {Why not an other anonymous work?},
    }

@book{Author+realauthor,
    Author = {Theauthor, Name},
    Realauthor= {Therealauthor, Name},
    Title = {That is a work with an author plus a real author},
    }

@book{Only-realauthor,
    Realauthor= {Therealauthor, Name},
    Title = {Here a work with only a real author},
    }

```

2.2 Loading of the biblatex package

When loading the biblatex package, use the `realauthor` bibstyle, which is based on the `verbose` bibstyle:

```
\usepackage[citestyle=verbose,bibstyle=realauthor]{biblatex}
```

Not that the package patches `author` and `author/editor/others/translator+others+` macro. If you redefine them, don't forget the patches¹.

¹We suppose that, if you redefine them, you could understand the packages.

2.3 Example of result

By default, the real author name is printed in brackets, with an equal, between fine non-break spaces, when a pseudonym is also used:

[Jean le Clerc]. *Défense des sentimens De quelques Théologiens de Hollande sur l'histoire critique du Vieux Testament contre la réponse du Prieur de Bolleville.*
Henry Desbordes, 1686

Prieur de Bolleville [=Richard Simon]. *Réponse au livre intitulé sentimens de quelques Theologiens de Hollande sur l'Histoire Critique du Vieux Testament.*
Rotterdam: Reinier Leers, 1686

2.4 Labelname field

This package, since version 2.0.0, declares the `realauthor` name as the `labelname`, if a `author` name is not defined.

That implies this field is used for:

- Sorting.
- *ibid / op. cit* abbreviation.

Note that this field is not affected by `useauthor` option, but it is by `userealauthor` option § 3.

Used in a bibliography macro or driver, `\ifuserealauthor{\langle true \rangle}{\langle false \rangle}` expands to `\langle true \rangle` if the `userealauthor` option is enabled (either globally or for the current entry), and `\langle false \rangle` otherwise.

2.5 Sorting

The default sorting schemes `nty` is problematic, because it doesn't consider the `realauthor` field as a name. That is why the package provides two sorting schemes:

- `anonymous`, which considers the `realauthor` field to sort list by authors' name. If an entry has both `realauthor` and `author`, only the `author` field will be used.
- `anonymous+realauthor`, which pushes the anonymous texts at the beginning of the list (as the `anonymous` sorting of the *biblatex-anonymous+* package), but considers the `realauthor` field to sort list by authors' name (as the `realauthor` sorting).

See the example file to have an illustration.

3 Disable realauthor use

The package, or rather biblatex, defines an `userealauthor` option, which can be settable on a per-entry basis in the `options` field, or by `entrytype`, using `\ExecuteBibliographyOptions`, or globally, when loading biblatex.

This option, when set to false:

- Disable use of `realauthor` as label name.
- Disable use of `realauthor` for sorting.
- With the default style, and contrary to the `useauthor` option, also disable printing of `realauthor`.

4 Customization

You can redefine the `\mkrealauthor` command to change the way the real author name is printed. Default value is:

```
\newcommand{\mkrealauthor}[1]{\mkbibbrackets{#1}}
```

You can also redefine the `\realauthorequalsign` command to change the sign before the real author name when a pseudonym is also used. Default value is:

```
\newcommand{\realauthorequalsign}{\addnbthinspace=\addnbthinspace}
```

For more customization, you have to redefine the macros defined in `realauthor.bbx`.

5 Use with biblatex-manuscripts-philology

To use this package with the features of `biblatex-manuscripts-philology`, you must use the package `biblatex-multiple-dm`.

6 Credits

This package was created for Maïeul Rouquette's phd dissertation² in 2014. It is licensed on the *LATEX Project Public License*³.

All issues can be submitted, in French or English, in the GitHub issues page⁴.

7 Change history

2.2.0 2015-04-26

Add new `userealauthor` option. Require biblatex 3.0. 3

Provide good file version in the `\ProvidesFile` command.

2.1.0 2014-10-30

Add new `realauthor` scheme. 2.5

2.0.0 2014-10-27

Print the `realauthor` name in bracket when cited in a abbreviated form.

Define `realauthor` as `labelname`. 2.4

1.1.0 2014-10-09

In a bibliographical list, print the last name before the first name of a real author, except if a `author` is defined.

Add `anonymous+realauthor` sorting scheme. 2.5

Compatibility with `@article` entry.

1.0.0 2014-06-25

First public release.
