

# The atbegshi package

Heiko Oberdiek\*

2019/12/05 v1.19

## Abstract

This package is a modern reimplementaion of package `everyshi` without the burden of compatibility. It makes use of  $\varepsilon$ -TeX's if available. Both L<sup>A</sup>TeX and plain TeX are supported.

## 1 Documentation

Package `atbegshi` redefines `\shipout` to insert hooks for user code that is executed before the page is shipped out. The code may modify or even discard the output page. Three hooks are implemented:

1. A hook that is executed for every page, see `\AtBeginShipout`
2. A hook that is executed for the next page only, see `\AtBeginShipoutNext`
3. A hook that is only executed for the first page, see `\AtBeginShipoutFirst`

The hooks are executed in this order. The following three macros provide the user interface for adding code to these hooks:

<code>\AtBeginShipout {⟨code⟩}</code> <code>\AtBeginShipoutBox</code>
--

Execute the `⟨code⟩` for every page. The page contents is held in box register `\AtBeginShipoutBox` and may be modified. Use `\AtBeginShipoutDiscard` if you want to discard the page.

*Note:* Package `everyshi` uses box register 255. With package `atbegshi` you must use `\AtBeginShipoutBox` instead.

If  $\LaTeX$  calls `\shipout` in `\@outputpage` (part of its output routine), the meaning of `\protect` is `\noexpand`.  $\LaTeX$  sets `\protect` to the appropriate `\@typeset@protect` in the box that is shipped out. This is too late for the hooks, they are called earlier in the redefined `\shipout`. Therefore package `atbegshi` sets `\protect` to `\@typeset@protect` before it calls the hooks. (In `\EveryShipout` of package `everyshi` the user is responsible for the correct setting of `\protect`.)

`\AtBeginShipoutNext`  $\{\langle code \rangle\}$

This reimplements package `everyshi`'s `\AtNextShipout`. The  $\langle code \rangle$  is executed at shipout time of the next page only. It is just a convenience macro, it can be easily replaced by something like:

```
\newcommand{\MyShipoutHook}{}%
\AtBeginShipout{\MyShipoutHook}
\gdef\MyShipoutHook{%
  ... do something with next page ...
\gdef\MyShipoutHook{}}
}
```

(This can be necessary, if hook order does matter).

`\AtBeginShipoutFirst`  $\{\langle code \rangle\}$

This reimplements  $\LaTeX$ 's `\AtBeginDvi`. This hook is usually used for `\special` commands that include PostScript header files. The `\code` is directly executed in a `\vbox` that is put at the beginning of the output page. Dealing with the output box `\AtBeginShipoutBox` is not necessary and not permitted here.

`\AtBeginShipoutDiscard`

This macro notifies package `atbegshi` that the output page is discarded. The remaining hook code and the remaining hooks are not executed and the page is thrown away. Also `\deadcycles` is cleared to zero like an ordinary `\shipout` would do.

`\AtBeginShipoutInit`

Usually the redefinition of `\shipout` is delayed by `\AtBeginDocument` (if this macro exists). This can be too late, if other packages also redefines `\shipout` and the order does matter. `\AtBeginShipoutInit` forces the immediate redefinition of `\shipout`.

`\AtBeginShipoutAddToBox`  $\{\langle stuff \rangle\}$   
`\AtBeginShipoutAddToBoxForeground`  $\{\langle stuff \rangle\}$

A quite common use case is the addition of `\special` or other whatsits to the page output box. Macro `\AtBeginShipoutAddToBox` puts  $\langle stuff \rangle$  in a box with zeroed dimensions. The box with the  $\langle stuff \rangle$  is put in the upper left corner of the shipout box `\AtBeginShipoutBox`. Macro `\AtBeginShipoutAddToBox` puts the  $\langle stuff \rangle$  in

the background, the other macro `\AtBeginShipoutAddToBoxForeground` in the foreground after the original shipout box contents is set.

A void shipout box (that means a discarded page) remains void that means  $\langle stuff \rangle$  is ignored in this case. The box type of `\AtBeginShipoutBox` is preserved. Also the box nesting level for the original contents of `\AtBeginShipoutBox` remains, for example, to avoid trouble with links across pages in case of pdfTeX.

`\AtBeginShipoutUpperLeft`  $\{\langle background material \rangle\}$

This is a macro that puts material in the background of box `\AtBeginShipoutBox`. The  $\langle background material \rangle$  is set in an `\hbox`, the reference point is the upper left corner of the output page. In case of pdfTeX in PDF mode, the settings of `\pdfhorigin` and `\pdfvorigin` are respected.

The macro `\AtBeginShipoutUpperLeft` is intended to be used in one of the hook setting macros, such as `\AtBeginShipout`, `\AtBeginShipoutFirst`, or `\AtBeginShipoutNext`.

For L<sup>A</sup>T<sub>E</sub>X users the  $\langle background material \rangle$  is set inside a `picture` environment:

```
\begin{picture}(0,0)
  \setlength{\unitlength}{1pt}%
  \langle background material \rangle
\end{picture}
```

`\AtBeginShipoutUpperLeftForeground`  $\{\langle foreground material \rangle\}$

See `\AtBeginShipoutUpperLeft`. The difference is that the material is put in the foreground.

`\AtBeginShipoutOriginalShipout`  $\langle box \rangle$

It stores the meaning of `\shipout` at the time this package is loaded.

`\AtBeginShipoutBoxWidth`  
`\AtBeginShipoutBoxHeight`  
`\AtBeginShipoutBoxDepth`

These macros store the dimensions of the output box `\AtBeginShipoutBox` before the original shipout is called. If `\shipout` is not redefined before the package loading or the box dimensions are not changed by the redefined `\shipout`, these macros contain the dimensions of the shipout box. These values can be remembered by `\label` and `\ref`. For example, this is done by the package module `zref-pagelayout` of project `zref`. The dimensions of the shipout page can be used in some T<sub>E</sub>X engines (pdfTeX in PDF mode, X<sub>Y</sub>TeX) to calculate the media size of the shipout page if `\pdfpagewidth` and `\pdfpageheight` are not set.

## 1.1 Examples

### 1.1.1 Example: circle in background

In this example we put a circle in the background in the middle of the paper.

```
1 \langle *example1 \rangle
```

```

2 \documentclass[a4paper]{article}
3 \usepackage{color}
4 \usepackage{atbegshi}

```

Package `picture` makes life a little easier, because we can now also use length specifications in `picture`'s commands.

```
5 \usepackage{picture}
```

Now we draw the circle in the middle of the paper. `\put` moves downwards, because the origin is at the top of the page, not at its bottom.

```

6 \AtBeginShipout{%
7   \AtBeginShipoutUpperLeft{%
8     \put(0.5\paperwidth,-0.5\paperheight){\circle{10}}%
9   }%
10 }
11 \begin{document}
12 \section{Hello World}
13 \newpage
14 \AtBeginShipoutNext{%
15   \AtBeginShipoutUpperLeft{%
16     \color{red}%
17     \put(0,-0.5\paperheight){\line(1,0){\paperwidth}}%
18     \put(0.5\paperwidth, 0){\line(0,-1){\paperheight}}%
19   }%
20 }
21 Only on this page we add a red cross.
22 \newpage
23 This page has the circle only.
24 \par
25 \vspace{\fill}
26 The next page will be discarded.
27 \newpage
28 \AtBeginShipoutNext{%
29   \AtBeginShipoutDiscard
30 }
31 This page is discarded.
32 \newpage
33 The last page.
34 \end{document}
35 \end{example1}

```

### 1.1.2 Example: adding `TrimBox` for `dvipdfmx`

Now an example from “real life” follows. Someone from the mailing list for `dvipdfmx` wants to put a `TrimBox` on every page. If we use `\AtBeginShipout`, we have to put the `\special` inside the box `\AtBeginShipoutBox` that gets shipped out.

```

36 \begin{example2}
37 \documentclass{minimal}
38 \usepackage{atbegshi}
39 \usepackage[
40   dvipdfm,
41   paperwidth=630bp,
42   paperheight=810bp
43 ]{geometry}
44 \AtBeginShipout{%
45   \setbox\AtBeginShipoutBox=\hbox{%
46     \special{pdf: put @thispage <</TrimBox[9 9 621 801]>>}}%

```

```

47   \box\AtBeginShipoutBox
48   }%
49 }
50 \begin{document}
51   First page
52   \newpage
53   Second page
54 \end{document}
55 \end{example2}

```

Remember, in `\AtBeginShipoutBoxFirst` the `\setbox` wrapper code is implicitly given and the `\special` is used directly.

## 2 Method of `\shipout` overloading

### 2.1 `\shipout`

The TeX primitive command `\shipout` takes a box specification and puts the box as a new page in the output file. There are two kinds of box specifications:

**Direct boxes:** They are given by `\hbox`, `\vbox`, or `\vtop`,  
e.g. `\shipout\hbox{Hello World}`.

**Indirect boxes:** `\box` or `\copy` references a box register by number. The box register contains the contents of the box.

*Note:* `\box` also clears the box register globally.

Then we have to differentiate between void and empty boxes:

**Void:** Initially or after `\box` there is no box in the box register. In this cases the box register is not empty, but *void*.

**Empty:** A box with empty contents, such as `\hbox{}` (= `\null`) or `\vbox{}` is an *empty hbox* or *empty vbox*. If a box register holds such a box, the box still exists, therefore the box register is *not void*.

### 2.2 `\afterassignment`

We want to overload `\shipout` to do something with the box. It is quite impossible to do this reliable by catching the box using macro arguments. The variety of box specifications is too large, Examples:

```

\shipout\null
\shipout\vbox{...}
\shipout\vtop\bgroup ... \egroup
\shipout\box255

```

Even worse, the braces don't need to be balanced:

```

\shipout\hbox\bgroup}
\shipout\vbox{\egroup

```

Happily TeX provides a reliable way via `\afterassignment`. It takes a macro name and executes it just after the assignment.

Now we can redefine `\shipout`. The box specification that follows `\shipout` is caught by `\setbox`. This is an assignment to a box register. `\afterassignment` notifies TeX, that we want to call `\@test` right after the assignment:

```

\shipout :=
  \afterassignment\@test
  \setbox\mybox=

```

We have seen different box specifications. Indirect boxes are easy to understand:

```

\shipout\box0 ⇒ \setbox\mybox=\box0 \@test

```

However direct boxes can have arbitrary contents with lots of other assignments. It would be quite unpredictable if  $\text{\TeX}$  would put  $\@test$  after the first of such an assignment or after the box specification if the box lacks of assignments. Therefore  $\text{\TeX}$  puts  $\@test$  right at the beginning of the box specification, e.g:

```

\shipout\hbox{Hello World}
⇒ \setbox\mybox=\hbox{\@test Hello World}

```

## 2.3 Test for direct or indirect boxes

Now we want to execute  $\@test$ , but where are we? We can be after the completed box assignment, if  $\@test$  was called with an indirect box. Or we are right at the beginning of a direct box.

### 2.3.1 With $\varepsilon\text{-TeX}$

With the  $\varepsilon\text{-TeX}$ 's extensions the answer is very easy: Being inside the direct box means that we are inside a new group. The new primitive command  $\@currentgrouplevel$  tells how deeply the groups are currently nested. Macro  $\@test$  just compares the previously stored group level with the current one:

```

\shipout :=
  \edef\saved@grouplevel{\number\currentgrouplevel}
  \afterassignment\@test
  \setbox\mybox=

\@test :=
  \ifnum\saved@grouplevel=\currentgrouplevel
    % case: indirect box, the assignment is completed
    \@output
  \else
    % case: direct box, we are inside the box
    \aftergroup\@outbox
  \fi

```

### 2.3.2 Without $\varepsilon\text{-TeX}$

Life becomes complicate without  $\varepsilon\text{-TeX}$ . We cannot ask the group level. However, if we are inside a direct box, the box register  $\@mybox$  is not yet changed by  $\@setbox$ . Thus we need a special initial value and compare it in  $\@test$  with the current value of the box.

What can be used as initial value? Arbitrary box contents cannot be compared.  $\text{\TeX}$  only tells us a few properties:

- Box type:  $\@ifhbox$ ,  $\@ifvbox$
- Dimensions:  $\@wd$ ,  $\@ht$ ,  $\@dp$
- Voidness:  $\@ifvoid$

Unhappily all these qualities even combined are not sufficient for constructing an initial box value, because `\shipout` can be called with a box that is accidentally just the same as the chosen initial value.

Nevertheless we have two alternatives for an initial value:

- A box of some type with some funny settings that are unlikely to occur in real life, e.g a height of `4911sp-\maxdimen`.
- A void box.

A collision between this initial value and an indirect `\shipout` box with just the same value is possible. Then `\@test` will make a wrong decision that it is executed inside a direct box and delays `\@output` by `\aftergroup`. Thus `\@output` is not called at the place we want. In contrary, the result is an uncertainty about the place:

- `\shipout` is used in a group that perhaps closes some pages later. A bad place for `\@output`.
- Without a surrounding group `\aftergroup` effectively kills its argument.

In the first case of a box with special dimensions we can even lose the page. However in the case of the void box, this effect is even desired, because the original `\shipout` does not output void boxes. All we have to do is to ensure that our box `\mybox` is always void except for the phase when the overloaded `\shipout` is executed. And secondly we must keep this semantics of `\shipout` for the void case in our macros, namely `\@output`.

```

\shipout :=
  % trick to get a void box \mybox
  \begingroup
    \setbox\mybox=\box\mybox
  \endgroup
  \afterassignment\@test
  \setbox\mybox=

\@test :=
  \ifvoid\mybox
    \aftergroup\@output
  \else
    \@output
  \fi

```

The nasty case is `\shipout\box\voidb@x` where the indirect box is void and that must not generate an output page. If a surrounding group is missing the output is ignored because of `\aftergroup`. Otherwise output is called some time later when the surrounding group closes. But `\mybox` is void outside the execution phase of the redefined `\shipout`. Also `\@output` checks for a void box and cancels the page output. The disadvantage remains that the hook in `\@output` is called for a page that will not be output.

### 2.3.3 `\lastkern` method

At the beginning of a new box, there is no `\kern`, the contents of the box is still empty and `\lastkern` returns 0 pt. This can be used to distinguish between direct and indirect boxes: We execute `\setbox` in a box with a preceding non-zero kern. After an indirect box, `\lastkern` sees this kern, otherwise it returns 0 pt.

```

\shipout :=
  \begingroup
  \setbox\mybox=\hbox\bgroup
  \kern1pt
  \afterassignment\shipout@test
  \global\setbox\mybox=
\@test :=
  \ifdim\lastkern=0pt
  % direct box
  \aftergroup\egroup
  \aftergroup\endgroup
  \aftergroup\@output
\else
  \egroup
  \endgroup
  \@output
\fi

```

We have two `\setbox` commands. The first creates a controlled context box where we can safely insert a `\kern`. We get rid of this temporarily used context box by putting the local `\setbox` in a group.

After the group we want to have our `shipout` box in `\mybox`. Therefore we use a global assignment here.

## 2.4 Output

With or without  $\varepsilon$ -TeX we ensure the original behaviour of `\shipout` that void boxes do not generate output pages.

Now we can place the hook `\@hook` for the user code that wants to manipulate the output box.

```

\@output :=
  \ifvoid\mybox
  % cancel output of void box
\else
  \@hook
  \ifvoid\mybox
  % user code in \@hook could has voided the box
\else
  \original@shipout\box\mybox
\fi
\fi

```

## 2.5 Separate box register

So far we have said nothing about the box number of `\mybox`. The following case that outputs the same page twice shows that we are not free in the use of the box register:

```
\shipout\copy<num> \shipout\box<num>
```

We manipulate the box by the hook and without  $\varepsilon$ -TeX the box must even be voided. However, the use case above requires that the box contents does not change at all. Therefore we must reserve a separate box register to avoid collisions with user box registers.

*Note:* Box register number 255 is special for the output routine, because TeX complains if this box is not voided by the output routine. However, this requirement does not apply to `\shipout` at all. In fact `\shipout` does not change any

box register. This is usually done by a call of `\box`, but the output routine can do it later *after* invoking of `\shipout`.

## 2.6 Summary

### 2.6.1 With $\varepsilon$ -TeX

Putting the pieces together we get for  $\varepsilon$ -TeX:

```

\newbox\mybox
\let\original@shipout\shipout

\shipout :=
  \edef\saved@grouplevel{\number\currentgrouplevel}
  \afterassignment\@test
  \setbox\mybox=

\@test :=
  \ifnum\saved@grouplevel<\currentgrouplevel
    \expandafter\aftergroup
  \fi
  \@output

\@output :=
  \ifvoid\mybox
    % cancel output of void box
  \else
    \@hook
    \ifvoid\mybox
      % user code in \@hook could have voided the box
    \else
      \original@shipout\box\mybox
    \fi
  \fi

```

### 2.6.2 Without $\varepsilon$ -TeX, traditional way

And for TeX without  $\varepsilon$ -TeX:

```

\newbox\mybox
\begingroup
  \setbox\mybox=\box\mybox % ensure \mybox is void
\endgroup
\let\original@shipout\shipout

\shipout :=
  % trick to get a void box \mybox
  \begingroup
    \setbox\mybox=\box\mybox
  \endgroup
  \afterassignment\@test
  \setbox\mybox=

\@test :=
  \ifvoid\mybox
    \expandafter\aftergroup
  \fi
  \@output

```

```

\@output :=
  \ifvoid\mybox
    % cancel output of void box
  \else
    \@hook
    \ifvoid\mybox
      % user code in \@hook could have voided the box
    \else
      \original@shipout\box\mybox
    \fi
  \fi

```

### 2.6.3 \lastkern method

And for  $\text{\TeX}$  without  $\varepsilon\text{-TeX}$  using the `\lastkern` method:

```

\newbox\mybox
\let\original@shipout\shipout

\shipout :=
  \begingroup
  \setbox\mybox=\hbox\bgroup
  \kern1pt
  \afterassignment\@test
  \setbox\mybox=

\@test :=
  \ifdim\lastkern=0pt
    \expandafter\aftergroup
  \fi
\@output

\@output :=
  \egroup
  \endgroup
  \ifvoid\mybox
    % cancel output of void box
  \else
    \@hook
    \ifvoid\mybox
      % user code in \@hook could have voided the box
    \else
      \original@shipout\box\mybox
    \fi
  \fi

```

## 3 Implementation

Package `atbegshi` uses  $\varepsilon\text{-TeX}$ 's `\currentgrouplevel`, if it is available. Otherwise the `\lastkern` method is used.

```
56 (*package)
```

### 3.1 Reload check and package identification

Reload check, especially if the package is not used with  $\text{\LaTeX}$ .

```
57 \begingroup\catcode61\catcode48\catcode32=10\relax%
58 \catcode13=5 % ^~M
```

```

59 \endlinechar=13 %
60 \catcode35=6 % #
61 \catcode39=12 % '
62 \catcode44=12 % ,
63 \catcode45=12 % -
64 \catcode46=12 % .
65 \catcode58=12 % :
66 \catcode64=11 % @
67 \catcode123=1 % {

## 4 Installation

### 4.1 Download

**Package.** This package is available on CTAN<sup>1</sup>:

[CTAN:macros/latex/contrib/atbegshi/atbegshi.dtx](https://ctan.org/ctan/ctan/macros/latex/contrib/atbegshi/atbegshi.dtx) The source file.

[CTAN:macros/latex/contrib/atbegshi/atbegshi.pdf](https://ctan.org/ctan/ctan/macros/latex/contrib/atbegshi/atbegshi.pdf) Documentation.

**Bundle.** All the packages of the bundle ‘atbegshi’ are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

[CTAN:install/macros/latex/contrib/atbegshi.tds.zip](https://ctan.org/ctan/ctan/install/macros/latex/contrib/atbegshi.tds.zip)

*TDS* refers to the standard “A Directory Structure for  $\TeX$  Files” ([CTAN:pkg/tds](https://ctan.org/ctan/ctan/pkg/tds)). Directories with `texmf` in their name are usually organized this way.

### 4.2 Bundle installation

**Unpacking.** Unpack the `atbegshi.tds.zip` in the TDS tree (also known as `texmf` tree) of your choice. Example (linux):

---

<sup>1</sup>[CTAN:pkg/atbegshi](https://ctan.org/ctan/ctan/pkg/atbegshi)

```
unzip atbegshi.tds.zip -d ~/texmf
```

### 4.3 Package installation

**Unpacking.** The `.dtx` file is a self-extracting docstrip archive. The files are extracted by running the `.dtx` through plain  $\TeX$ :

```
tex atbegshi.dtx
```

**TDS.** Now the different files must be moved into the different directories in your installation TDS tree (also known as `texmf` tree):

```
atbegshi.sty      → tex/generic/atbegshi/atbegshi.sty
atbegshi.pdf      → doc/latex/atbegshi/atbegshi.pdf
atbegshi-example1.tex → doc/latex/atbegshi/atbegshi-example1.tex
atbegshi-example2.tex → doc/latex/atbegshi/atbegshi-example2.tex
atbegshi.dtx      → source/latex/atbegshi/atbegshi.dtx
```

If you have a `docstrip.cfg` that configures and enables docstrip's TDS installing feature, then some files can already be in the right place, see the documentation of docstrip.

### 4.4 Refresh file name databases

If your  $\TeX$  distribution ( $\TeX$ Live, `mik $\TeX$` , ...) relies on file name databases, you must refresh these. For example,  $\TeX$ Live users run `texhash` or `mktexlsr`.

### 4.5 Some details for the interested

**Unpacking with  $\LaTeX$ .** The `.dtx` chooses its action depending on the format:

**plain  $\TeX$ :** Run docstrip and extract the files.

**$\LaTeX$ :** Generate the documentation.

If you insist on using  $\LaTeX$  for docstrip (really, docstrip does not need  $\LaTeX$ ), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{atbegshi.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

**Generating the documentation.** You can use both the `.dtx` or the `.drv` to generate the documentation. The process can be configured by the configuration file `ltxdoc.cfg`. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with `pdf $\LaTeX$` :

```
pdflatex atbegshi.dtx
makeindex -s gind.ist atbegshi.idx
pdflatex atbegshi.dtx
makeindex -s gind.ist atbegshi.idx
pdflatex atbegshi.dtx
```

## 5 History

[2007/04/17 v1.0]

- First version.

[2007/04/18 v1.1]

- New method based on `\lastkern` is used if  $\varepsilon$ -TeX is missing.
- `\AtBeginShipoutDiscard` also resets `\deadcycles`.

[2007/04/19 v1.2]

- `\AtBeginShipoutEarly` removed for simplification reasons.
- Forgotten definition of `\AtBegShi@Info` added.
- Patches for packages `crop` and `everyshi` and class `memoir` added.

[2007/04/26 v1.3]

- Use of package `infwarerr`.
- Catcode section after generic header.

[2007/04/27 v1.4]

- Small optimizations.

[2007/06/06 v1.5]

- `\AtBeginShipoutUpperLeft` added.
- Example added.
- Fix in second test file for newer version of `memoir`.

[2007/09/09 v1.6]

- Catcode section rewritten.

[2008/07/18 v1.7]

- Documentation of `\AtBeginShipoutUpperLeft` fixed and extended.

[2008/07/19 v1.8]

- `\AtBeginShipoutUpperLeftForeground` added.

[2008/07/31 v1.9]

- Second example (`TrimBox` for `dvipdfmx`) added.
- No changes in package code.

[2009/12/02 v1.10]

- `\AtBeginShipoutOriginalShipout` added.
- Test file fixed.

[2010/03/01 v1.11]

- Compatibility with `ini-TeX` except for `\newbox`.

[2010/03/25 v1.12]

- `\AtBeginShipoutNext` can now be used inside `\AtBeginShipoutNext`.

[2010/08/18 v1.13]

- Fixes for `\AtBegShi@CheckDefinable`.

[2010/12/02 v1.14]

- Remove the warning because of void box if the hook calls `.`

[2011/01/30 v1.15]

- Already loaded package files are not input in plain `TeX`.

[2011/10/05 v1.16]

- `\AtBeginShipoutAddToBox`, `\AtBeginShipoutAddToBoxForeground` added.
- `\AtBeginShipoutBoxWidth`, `\AtBeginShipoutBoxHeight`, `\AtBeginShipoutBoxDepth` added.
- Updates for patches of class `memoir`.

[2016/05/16 v1.17]

- Documentation updates.

[2016/06/09 v1.18]

- Update for `\pdfhorigin` in new `LuaTeX`.

[2019/12/05 v1.19]

- Documentation updates.
- `iftex` package.

## 6 Index

Numbers written in *italic* refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; plain numbers refer to the code lines where the entry is used.
